

Nema Note 7-3

Sting Nematodes

www.ncagr.com/agronomi/uyrnem.htm

Laboratory analysis of this particular soil sample indicates the presence of sting nematodes. These nematodes can severely damage host plants growing on sandy soils but usually are not problems on heavy clay or organic soils. Soybeans, cotton, corn and peanuts are good hosts of sting nematodes; therefore, use of nematicides is recommended on these crops. It is a good practice to take soil samples and have them checked for nematodes before planting fields with any of these host crops.

For Additional Assistance

- Call your NCDA&CS regional agronomist or the Agronomic Division office in Raleigh (919-733-2655).
- Visit the NCDA&CS Agronomic Division Web site at www.ncagr.com/agronomi/.
- Visit your county Cooperative Extension office.
